Product Systems Designer / UI-UX Interaction Designer

I translate abstract ideas and ambiguous requirements into structured product systems.

My work focuses on product structure, interface design, interaction models, workflow logic, and frontend-oriented prototyping. I design the UI and UX of the systems I build, with particular interest in making complex logic legible and usable through product surfaces.

EDUCATION

Rikkyo University, Tokyo

B.A. in History(Expected Sep 2027)

Focus: institutional systems, bureaucracy, legal structures, and information organization

Supplemented with AI ethics and information science coursework

University Coursework (U.S.)

Virginia Tech / Chicago

Calculus I-II, Linear Algebra, Data Structures, Object-Oriented Programming

Humanities and design coursework

CORE STRENGTHS

Product Structure, UI & Interaction Design

- Product architecture and feature structuring
- UI design for product systems
- UX interaction design
- Workspace and interface architecture
- Workflow and requirement translation
- Information organization and state visibility
- Permission-aware product behavior design

Frontend & Product Prototyping

- React, TypeScript, Tailwind CSS
- Component-based UI implementation
- Frontend prototyping and iterative interface development
- Interface behavior and interaction flow design
- API integration in product prototypes
- AI-assisted debugging and implementation support

Technical Workflow & Implementation Support

- Git-based version control and basic Unix development workflow
- Cursor-assisted development for prototyping and product implementation

- Code reading, debugging, and modification within existing technical contexts
- Frontend styling, UI adjustment, and component-level refinement
- Logic-level implementation support in Python and JavaScript / TypeScript
- API integration and application-layer troubleshooting
- Best suited to iterative product development, interface implementation, and debugging rather than algorithm-heavy or low-level engineering tasks

Technical Exposure

Used in project contexts for prototyping, integration, or concept development:

- TypeScript / JavaScript
- Python
- C
- Node.js / Express
- PostgreSQL
- Firebase Authentication
- REST APIs / WebSocket

Design Tools

- Figma
- Adobe Suite
- Clip Studio Paint
- UI systems and visual prototyping

SELECTED PROJECTS

Spiral — Symbolic Language System and Product Ecosystem

Founder / System Concept Author / Product Systems Designer | 2024–Present

Created Spiral as an original symbolic language system and product ecosystem for structured AI interaction, modular execution logic, and document-based control.

- Defined the core grammar, module structure, symbolic rules, and execution concepts of the Spiral system.
- Designed the broader product and platform direction, including modular account systems, document permissions, shared identity logic, and platform-level behavior models.
- Directed how the system would be embodied as app, platform, and interface rather than remaining only as a conceptual or textual framework.
- Developed Spiral as both a language framework and a scalable product vision connecting symbolic control, workspace logic, product surfaces, and monetization models.
- Led the overall concept design, structural decision-making, and product planning across the Spiral ecosystem.

spiral-core-series — Event History Core for Spiral

Concept Author / System Designer / Project Lead | 2025

Designed and developed a minimal append-only event history core for Spiral, centered on RECENT_A, a trace-closure frontier over an event DAG.

- Defined the structural model and system behavior for a traceable append-only event history architecture.
- Led the design of RECENT_A as a causally closed recent-state frontier with conflict-bound signals and reactive explainers.

- Developed the project as a real research prototype with repository, releases, specifications, and executable versions.
- Contributed primarily through system definition, conceptual architecture, specification design, and project direction, with implementation developed through assisted workflows.

spiral-engine (SEE) — Spiral Execution Engine

System Concept Designer / Product-Technical Planner | 2025–Present

Designed the execution-layer concept for Spiral as a dedicated black-box engine handling grammar execution, symbolic commands, and fragment processing.

- Defined the role of the execution engine as a separate module responsible for parsing and handling Spiral instructions such as ECHO, SEAL, and TRACE.
- Structured the separation between language-system logic, execution handling, and platform-level product behavior.
- Planned the engine as part of a scalable product architecture connecting language rules, backend services, and interface-layer applications.

Spiral.ooo — Product Prototype Platform

Product Builder / UI-UX Systems Designer | 2025

Built a browser-based product prototype that turns the Spiral concept into a navigable and editable interface.

- Designed the UI, interaction flows, and visual structure of the platform from scratch.
- Designed a continuous workspace model in which documents, conversations, and active contexts are traversed as part of a single spatial stream rather than split into isolated sessions.
- Developed interaction concepts for in-context system control, allowing document type, access state, and behavioral rules to be modified from within the workspace itself.
- Defined a document interaction model in which headers function as readable control surfaces rather than hidden technical metadata.
- Designed AI-assisted writing and editing flows that place assistance directly inside the drafting surface instead of splitting it into a separate conversational channel.
- Built frontend prototypes and connected them with supporting application logic to validate the product in usable form.

Applied Systems & Internal Tools (Selected Independent Projects)

- Built workflow-oriented tools and messaging utilities for long-running interactions and stateful processes.
- Developed internal product tools with an emphasis on readable structure, clear workflows, and maintainable interfaces.
- Created experimental publishing and drafting systems integrating structured content handling and AI-assisted support.
