

XUE JUNTAO

Tokyo, Japan · r@rec.ooo · pf.rec.ooo · git.rec.ooo

Product Builder / Systems Designer

I design, build, and operate working product systems end-to-end — from data governance and written system standards to interface and deployment. Current flagship: Kiln (kiln.ooo), a deterministic text refinement product. Everything ships under a documented personal design language and governance system.

SELECTED WORK

Kiln — Deterministic Text Refinement (kiln.ooo)

Founder / Product Builder | 2026–Present

A live product that refines messy text through a strictly deterministic pipeline — parse → normalize → transform → render. No AI rewriting, no content generation: it only transforms existing text, with reproducible results.

- Governed by a written axiom layer (pipeline closure, module boundaries) that overrides all downstream specs and code
- Preset system (clean / notes / strong) over modular transforms; card/shelf workspace with drawer and projector views
- Self-built 8-locale static SEO pipeline generating localized landing pages, sitemap, and robots
- Operated as a complete product: docs site, onboarding walkthrough, auth, i18n, custom domain

Personal Systems Design — Fleet Governance & Data Standards

Standards Author / Operator | 2026–Present

A living standards system governing 20+ personal projects as one infrastructure: machine specs, a documented design language, tiered personal-data governance, and derivation contracts — all operating in production.

- 17+ machine specs (deploy / hosting / naming / ports / secrets / journaling) with one-click ritual scripts shared across all repos
- Documented UI design language: 8 mutually exclusive modes plus 51 cited anti-pattern rules distilled from shipped work
- Four-tier personal data governance with explicit AI permission boundaries, single source of truth, and all-or-nothing form automation
- This site itself is a derived view of the system: hard facts trace to the truth layer, soft content ships as versioned packs

CORE STRENGTHS

System Governance & Specification: Written system standards — deploy, hosting, naming, port registry, secrets — maintained as a living spec library governing 20+ repos; Tiered data governance (constants / state / curation / generation) with explicit AI permission boundaries; Provenance-first architecture: every derived surface traces back to a single source of truth

Product & Interface: End-to-end product construction: concept, data model, interaction design, implementation, deployment, SEO; A documented personal design language (8 exclusive UI modes, 51 cited anti-pattern rules) applied across all shipped products; Vanilla-first engineering: framework-free static systems, Chrome extensions (MV3), PWA, React/TypeScript where warranted

Disciplined AI-Assisted Development: AI-assisted implementation under explicit direction, with axiom layers and specs that override any generated code; Conservative automation principles: learned data first, all-or-nothing matching, refuse over guess; Full control of system structure and behavior; AI is a tool, never the author of record

Stack: TypeScript / JavaScript, Python, Node.js, React, PostgreSQL, REST / WebSocket, Chrome Extension (MV3), GitHub Pages / Vercel / DNS ops

EDUCATION

Rikkyo University, Tokyo — B.A. in History (Expected Sep 2027)

Focus: institutional systems, bureaucracy, legal structures, information organization.

University Coursework (U.S.) — Virginia Tech / Chicago

Calculus I–II, Linear Algebra, Data Structures, Object-Oriented Programming.

LANGUAGES

Chinese (Native) · English (Fluent) · Japanese (Fluent / JLPT N1)
